

## Non-archimedean analytic continuation of unobstructedness.

Main result.  $(L_s : s \in S)$  is a smooth family of graded or vanishing Maslov index Lagrangian submanifolds in  $(M, \omega)$ . Assume  $S$  is connected. Let  $s_0 \in S$

Theorem If  $L_{s_0}$  is properly unobstructed, then all  $L_s$  is properly unobstructed

### Remark

monotone  $\Rightarrow$  properly unobstructed  $\Leftrightarrow$  usual unobstructed  
 (will explain soon)  
 only involve Maslov-0 disks

(a subcase of )  
 in the literature  
 (FOOO & Kontsevich).

Maslov index  
 always  $> 0$

Application : ① Rizell - Goodman - Ivrii :

Let  $(X, \omega)$  be either of  $(\mathbb{R}^4, \omega_{std})$ ,  $(\mathbb{C}\mathbb{P}^2, \omega_{FS})$ ,  $(S^2 \times S^2, \omega_1 \oplus \omega_1)$

Any two Lagrangian tori inside  $(X, \omega)$  are Lagrangian isotopic.

By our result

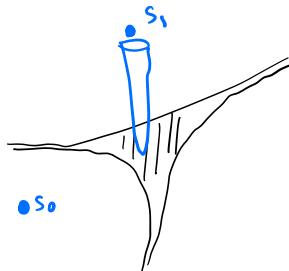

Corollary Any Lagrangian tori in  $(X, \omega)$  is <sup>(properly)</sup> unobstructed

Proof Pick a monotone Lag tori . . .

② Abouzaid - Auroux - Katzarkov

Lagrangian torus fibration on blowups of toric mfld. "negative vertex"

$$\pi: X \rightarrow B \quad \text{e.g. } X = \{uv=1+w_1+w_2\}, \quad B = \mathbb{R}^3$$

singular locus  $\Delta \subseteq B$

Wall region

$$\Omega = \{x \in B_0 \mid L_x \text{ bounds Maslov-0 disk}\}$$

then  $\Omega \cong \text{Diagram} \times \mathbb{R} \setminus \{0\}$

Corollary

units of  $L_{s_0}$  (trivial)

$$\Delta \cong \text{Diagram} \times \{0\}.$$

$\Downarrow$   
units of  $L_{s_1}$  (nontrivial) as  $L_{s_1}$  bounds Maslov-0 disks.

- Lagrangian Floer cohomology (Review):  $L_0, L_1$  transversal

$$CF(L_0, L_1) := \langle L_0 \cap L_1 \rangle$$

$$\bigcup_{\delta \text{ counts}} \delta \quad \delta(g) = \#(\dots) \cdot p$$

$$\text{Hope } HF(L_0, L_1) = H^*(CF(L_0, L_1), \delta)$$

$$\begin{matrix} \text{"} \delta \circ \delta = 0 \text{"} \\ \text{"} \partial \text{"} \end{matrix} \quad \begin{matrix} L_0 \\ L_1 \end{matrix}$$

$$\longrightarrow \quad \begin{matrix} L_0 \\ L_1 \end{matrix}$$

in general

$$\begin{matrix} L_0 \\ L_1 \end{matrix}$$

- Obstruction:

$$\delta \circ \delta \neq 0 \text{ in general.}$$

bubbling off disks is a phenomenon of codimension one  $\xrightarrow{\text{affect Stokes}}$   
(not two).  
 even a single disk  
 $\downarrow$   
curved  $A_\infty$  algebras

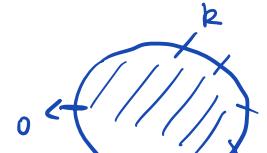

- $A_\infty$  algebra associated to a Lagrangian submanifold

$\forall k \geq 0, \forall \beta \in H_2(X, L)$   
 \* a collection of multilinear maps

or  $\boxed{\check{m}_k = \sum T^\omega(\beta) \check{m}_{k,\beta}}$

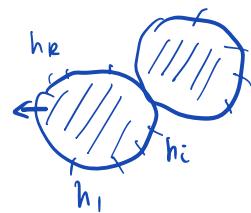

$$\check{m}_{k,\beta} : \Omega^*(L)^{\otimes k} \longrightarrow \Omega^*(L)$$

of degree  $2 - k - \mu(\beta)$ . such that  
Maslov index.

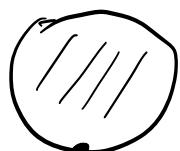

$\check{m}_{k+1,\beta}(J, L)$

$$\sum_{k_1+k_2=k+1} \sum_{\beta_1+\beta_2=\beta} \sum_{i=0}^{k_1} (-1)^* \check{m}_{k_1, \beta_1}(h_1, \dots, h_i, \check{m}_{k_2, \beta_2}(\dots), \dots, h_k) = 0$$

\* The curvature term  $\check{m}_{0,\beta}$  counts

(1 marked pt.)

$\leadsto$  obstruction of " $\delta \circ \delta = 0$ "

$$\Rightarrow \delta \circ \delta \neq 0$$

(Weak)

- Bounding cochain (FOOO & Kontsevich)

$b = \sum T^{\lambda_i} b_i \in \Omega^{\text{odd}}(L) \otimes \Lambda_0$  such that

$$\sum_{k=0}^{\infty} \sum_{\beta} T^{\omega(\beta)} m_{k,\beta}(b \dots b) = 0 \quad (\text{or } c \cdot 1)$$

Defn People call  $L$  unobstructed if  $\exists$  such  $b$

Then, we can "formally" define a deformed  $A_\infty$  algebra

$$m_k^b(x_1, \dots, x_k) = m(b \dots b, x_1, b \dots b, x_2, \dots)$$

with the curvature term  $m_0^b = 0$ .

Question any other approach possible ?

Reasons to rethink

① The existence of  $b$  is usually unknown.

(2) making a choice always means loss of information.

- \* That's why we need to study what happens for a different choice.
- \* In the case of boundary cochains, we get "gauge equivalence".
  - Mauro-Cartan set
  - But, only a set.

FOOO: the solution space of  $b$  modulo gauge equivalence is set-theoretically invariant up to homotopy equivalence of  $A_\infty$  algebras.

- lose info
- unpractical for explicit computation.
- ↓ not strong enough in practice  
e.g.  $\mathrm{HH}^*$  as a ring is NOT invariant

pro: work for most general case: even negative index

However

in practice, we often like graded or vanishing Maslov index

Lagrangian submanifolds. (Calabi-Yau, mirror symmetry)

$\Rightarrow \mu(\beta) \geq 0$  when  $\beta \in H_2(X, L)$  is represented by a holomorphic disk  $u$

Let's propose a different notion of unobstructedness.

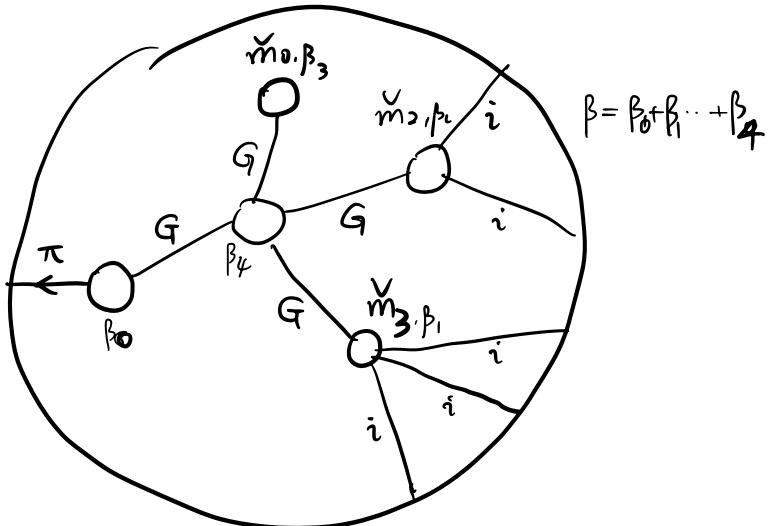

By homological perturbation, the  $\check{m}$  on  $\underbrace{\Omega^*(L)}_{\dim = \infty}$  induces

$$m_{k,\beta} : H^*(L)^{\otimes k} \rightarrow H^*(L)$$

$\dim < \infty !$

Intuitively:

$$m_{k,\beta} = \sum$$

"holomorphic pearly trees"

Remark We know  $\check{m} \xrightarrow{\text{homotopy of } A_\infty} m$ . We know  $MC(\check{m}) \xrightarrow{\text{set}} MC(m)$

But, homotopy equivalence (quasi-isomorphism) may be not strong enough

e.g. we know very little about  $H\check{H}^*(\check{m})$  v.s.  $HH^*(m)$

e.g.  $m$  on  $H^*(L)$  captures the info of a Riemannian metric, but  $\check{m}$  on  $\Omega^*(L)$  does not

Recall  $\mu(\beta) \geq 0$

$$\deg m_{k,\beta} = 2 - k - \mu(\beta).$$

$$\Rightarrow m_{0,\beta} \in H^{2-\mu(\beta)}(L) \quad \begin{cases} H^0(L) & \text{Maslov-2} \\ H^2(L) & \text{Maslov-0} \end{cases}$$

Denote the basis of  $H^0(L)$ ,  $H^2(L)$  by  $\mathbf{1}$ ,  $\Theta_1, \dots, \Theta_\ell$

- We write

$$\sum T^{E(\beta)} Y^{\partial\beta} m_{\alpha, \beta} = W^J \cdot \mathbf{1} + \sum_{i=1}^l Q_i^J \cdot \Theta_i$$

"formal symbol"

where  $W, Q_i \in \bigwedge [H_1(L)]$ .  
(like group ring)

- For different choice, we also have  $m', W', Q'_i$

Theorem A (Key)  
 $Q_i \equiv 0 \forall i \text{ iff } Q'_i \equiv 0 \forall i$

↑  
necessary

Defn We say  $L$  is properly unobstructed if  $Q_i \equiv 0$

Prop properly unobstructed  $\Rightarrow$  usual unobstructed

Roughly, if  $(y_1, \dots, y_n)$  is a zero of  $Q_i$ 's then  $x_i = \log y_i$  gives a usual boundary cochain

Recall:

Main Theorem If  $L_{s_0}$  is p. unob, then all  $L_s$  are p. unob.

$$\{L_s : s \in S\}$$

## Idea

Consider  $A = \{s \in S \mid L_s \text{ is properly unobstructed}\}$  due to Theorem A well defined

?

non-empty	✓
open	Fukaya's trick + <span style="border: 1px solid blue; padding: 2px;">Theorem A</span>
closed	a uniform version of reverse isoperimetric inequality

- Note that the convergence domain  $\mathcal{U}$  of  $Q_i$

may differ from the convergence domain  $\mathcal{U}'$  of  $Q'_i$

- To give some concrete insight,

Prop Let  $f = \sum_{\omega \in \mathbb{Z}^n} c_\omega Y^\omega \in \Lambda[[Y_1^\pm, \dots, Y_n^\pm]]$   $U_\Lambda = \{x \in \Lambda \mid |x| = 1\}$   
 $f$  is identically zero iff  $f$  is <sup>(NA)</sup>convergence and vanishing on  $U_\Lambda^\circ$

Proof "=>":  $|c_\omega| \xrightarrow{\text{NA norm}} 0$  as  $|\omega| \rightarrow \infty$ . Arguing by contradiction.

may assume  $c_{\omega_0} = 1$  and  $|c_{\omega_0}| = \max |c_\omega| = 1$

Modulo the ideal of elements with norm < 1, we get

$$\bar{f} = \sum \bar{c}_\omega Y^\omega \quad \text{and} \quad \bar{c}_\omega = 0 \text{ for } |\omega| \gg 1.$$

Hence,  $\bar{f}$  is just a Laurent polynomial with  $\bar{c}_{\omega_0} = 1$

But  $f$  vanishing on  $U_\Lambda^\circ \Rightarrow \bar{f}$  vanishing on  $(\mathbb{C}^*)^n \Rightarrow \bar{f} = 0$

□

## Sketch of proof of Theorem A

By Gromov-Solomon's reverse isoperimetric ineq.

$W, Q_i, W', Q'_i \in \Delta\langle\Delta\rangle \subseteq \Lambda[[H_1(L)]]$  (with some adic convergence cond.)  
an affinoid algebra, say  $A$

Consider obstruction ideals  $\pi = (Q_i)$ ,  $\pi' = (Q'_i)$ . like AG  
(noetherian)

We aim to find an isomorphism  $A/\pi \xrightarrow{\varphi} A/\pi'$  of affinoid algebra.

Roughly,

the formula of  $\varphi$  is given by a pseudo-isotopy (due to Junwu Tu and Fukaya)

- But, one of the main problems is to find  $\varphi^{-1}$ .  
in the category of affinoid algebras.  
(not just in the category of sets.)

- Namely, we want to achieve  $\varphi^{-1} \circ \varphi = \text{id}$  and  $\varphi \circ \varphi^{-1} = \text{id}$ .

A key new point is to ensure the divisor axiom is functorial and especially is preserved when taking the homotopy inverse of an  $A_\infty$  quasi-isomorphism.

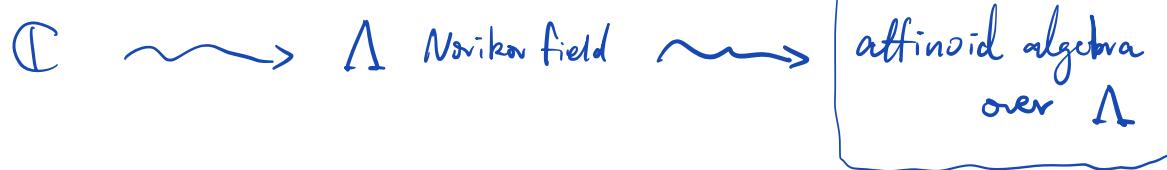

- Moreover, we can talk about the dimension of affinoid algebras.

The maximal ideal of  $A \longleftrightarrow$  a point in some  $\mathcal{U} \subseteq (\Lambda^*)^n$

$A/\pi \longleftrightarrow$  Zero locus of  $\pi$  in  $\mathcal{U}$ .

## Concluding Remark :

- coefficient in Lagrangian Floer

- Motivation from Mirror Symmetry :

We can also define  $D^b \text{Coh}$  on a non-archimedean analytic space.

Coherent sheaf  $\longleftrightarrow$  module over affinoid algebra

- Thus, it's natural to expect  $HF^*(L_1, L_2)$  is a module over affinoid algebra.
- An ultimate understanding of mirror symmetry should be like an intrinsic identification

$$D\text{Fuk}(X) \underset{\substack{\downarrow \\ \text{over affinoid alg}}}{\cong} D^b \text{Coh}(X^\vee) \underset{\substack{\downarrow \\ \text{NA analytic space}}}{\cong}$$
